FARM INCOME IN CANADA.

CASH RECEIPTS FROM FARM MARKETINGS, UNITED STATES.
1943-45 COMPARED WITH 1938-42 AVERAGE

U. S. DEPARTMENT OF AGRICULTURE

NEG. 45296 BUREAU OF AGRICULTURAL ECONOMICS

Total cash receipts from farm marketings during the first 10 months in 1945 were equal to or above 1943 and 1944 in all months except March, mainly because of pronounced gains in income from crops. Cash receipts this October were about the same as in 1944. Income in November is likely to be nearly as great as last year, but probably will decline less sharply from November to December than in 1944.

THE FARM INCOME SITUATIONIndications for December and January

In December total cash receipts from farm marketings are expected to decline about 10 percent from November, compared with a drop of 15 to 20 percent in recent years. The reason for this relatively small decline is the substantial gain in income from meat animals caused by delayed hog marketings. Cash receipts from meat animals dropped about 15 percent from November to December last year, as compared with an increase of 10 to 15 percent this year. The decrease in income from crops will not be quite so great as occurred last year. Cash receipts from the late maturing cotton crop probably will not make as great a decline as in 1944, and income from tobacco may be maintained at close to the November level because of relatively large sales of some of the more valuable types.

Cash receipts from farm marketings in January probably will decline about 10 percent from December, about the same as for the past 2 years. Income from crops may drop as much as 20 percent, as cash receipts from most crops decline seasonally. Cash receipts from tobacco and vegetables may be above December. Income from livestock and livestock products probably will be slightly below December, with a decline in cash receipts from poultry and eggs more than offsetting a gain in income from meat animals.

Preliminary Estimates for November

Cash receipts from farm marketings in November amounted to about 2,140 million dollars, about one-tenth below October and slightly less than the income of 2,183 million dollars in November 1944. Income from crops, at 1,070 million dollars, was one-fourth less than in October and one-tenth below November 1944. Income from nearly all crops dropped seasonally in November. Cash receipts from livestock and livestock products were about 1,070 million dollars, slightly above November 1944. The percentage increase in income from

livestock and livestock products from October to November was about the same as in the past 2 years.

For the first 11 months cash receipts from farm marketings were about 18,850 million dollars, slightly above the income of 18,531 million dollars for the same period in 1944. Income from crops was nearly one-tenth greater than last year, but cash receipts from livestock and livestock products were slightly less. Income from dairy products and from poultry and eggs showed substantial gains, whereas receipts from meat animals fell sharply.

State and Regional Estimates for September and First 9 Months

September

Total Cash receipts from farm marketings. The only region showing an appreciable change, compared with September 1944, was the West North Central, where an increase of one-tenth occurred, mostly because of crops. Receipts in the United States were about the same as last year.

Cash receipts from crops in the United States were about the same as in September 1944, ranging from 5 percent below last year in the North Atlantic Region to 19 percent above in the West North Central Region. Percentage changes in other regions were relatively small. A short apple crop in the North Atlantic Region was responsible for most of the decline. Receipts were especially high from the large flaxseed and oat crops in the West North Central Region.

Cash receipts from livestock and livestock products for the country as a whole showed no significant change from the same month last year. The greatest drop occurred in the East North Central Region, where severe declines in receipts from all types of meat animals brought about a drop of 6 percent in total livestock receipts. The largest gain, 4 Percent took place in the North Atlantic Region, where moderate increases in receipts from poultry, eggs, and wholesale milk more than made up for the drop in income from meat animals.

First 9 Months

Total cash receipts from farm marketings. By far the greatest increase over January-September 1944 was a 15-percent rise in the South Atlantic Region. The North Atlantic and South Central Regions were each about 5 percent higher. The only decrease occurred in the East North Central Region, despite a sizable increase in receipts from crops. Receipts in the country as a whole increased slightly.

Cash receipts from crops. Increases were shown in all regions, resulting in a gain of 15 percent for the United States. The smallest rise, 5 percent, was in the East North Central Region, where gains in receipts from wheat, oats, and soybeans more than offset rather sharp declines in income from fruit and dry edible beans. Sharp gains in income from wheat and corn in the West North Central Region reflected not only large 1945 production but heavy January carry-overs of 1944 crops as well, and an increase of 35 percent was shown in cash receipts from all crops.

Cash receipts from livestock and livestock products in the United States dropped 5 percent from last year. The greatest decrease was in the West North Central Region, where a particularly severe decline in cash receipts from hogs was largely responsible for a drop of 9 percent in total livestock receipts. In the North Atlantic Region a gain of 4 percent resulted from substantial increases in milk, poultry and eggs, which more than offset declines in income from meat animals.

North Atlantic Region

Cash receipts from crops in September dropped 5 percent from September 1944 as income from apples, grapes, and pears declined sharply. Increases in receipts from poultry and eggs and, to a lesser degree, from wholesale milk, resulted in a rise of 4 percent in income from livestock and livestock products above September last year.

For the first 9 months cash receipts from tobacco, potatoes, and truck crops rose sharply, and total income from crops increased 8 percent over 1944.

CASH RECEIPTS FROM FARM MARKETINGS, BY REGIONS, 1944-45 COMPARED WITH 1939-43 AVERAGE

DOLLARS
(MILLIONS)

NORTH ATLANTIC

SOUTH ATLANTIC

EAST NORTH CENTRAL

WESTERN

WEST NORTH CENTRAL

SOUTH CENTRAL

Cash receipts from wholesale milk, eggs, and chickens showed especially large gains, and income from livestock and livestock products increased 4 percent above last year.

East North Central Region

A sharp drop in cash receipts from fruit in September was offset by increases in income from feed crops, soybeans, and potatoes, and total cash receipts from crops showed no change from September 1944. Although income from wholesale milk and eggs made moderate gains, cash receipts from hogs and other types of meat animals showed greater declines, and income from livestock and livestock products dropped 6 percent from September last year.

Cash receipts from wheat and oats made marked gains in most major producing States during the period January through September, and total income from crops in the region increased 5 percent over 1944. Increases in income from wholesale milk, poultry, and eggs, were not great enough to offset the sharp decline in cash receipts from meat animals, especially from hogs, and income from livestock and livestock products decreased 6 percent.

West North Central Region

Increases in cash receipts from flaxseed, oats, and potatoes in September were especially important in bringing about a gain of one-fifth over September 1944 in income from crops. While income from cattle, chickens, and wholesale milk showed substantial gains, cash receipts from hogs, turkeys, and eggs dropped sharply, and only a slight rise was shown in income from livestock and livestock products.

Increases in cash receipts from wheat, and corn contributed greatly to the gain of about one-third in total income from crops for the first 9 months, compared with the same period last year. An unusually sharp decline in cash receipts from hogs, was mostly responsible for the 9 percent drop in income from livestock and livestock products, compared with last year.

South Atlantic Region

Cash receipts from apples and wheat dropped sharply in September from the same month last year, and total income from crops declined slightly. Cash receipts from meat animals dropped by nearly one-third, but offsetting gains were made by income from poultry, eggs, and milk, so that income from livestock and livestock products registered no change.

For the first 9 months, gains in income from tobacco, truck crops, and cotton lint were important in bringing about the increase of one-fifth over 1944 in cash receipts from crops. Gains in income from poultry, eggs, and milk were great enough to make up for the sharp decline in cash receipts from meat animals, and a slight increase was shown in income from livestock and livestock products.

South Central Region

Cash receipts from cottonseed and wheat in September were down sharply from the same month in 1944, but income from cotton lint increased substantially, so that total cash receipts dropped only slightly. Pronounced declines in income from hogs occurred in all States, but these were accompanied by small increases in most other livestock items, resulting in no significant change for cash receipts from all livestock and livestock products.

Increases in income from cotton lint, tobacco truck crops, and fruit figured prominently in the gain of one-eighth in cash receipts for crops during the first 9 months, compared with the same period last year. Income from hogs dropped sharply and, although cash receipts from milk and eggs made definite gains, income from all livestock and livestock products declined slightly.

Western Region

Large gains in cash receipts from wheat, pears, truck crops, and peaches in September over September 1944 were nearly offset by decreases in receipts from grapes and dry field peas, so that total income from crops showed only a slight rise. Income from meat animals and turkeys declined, and cash receipts from livestock and livestock products dropped 5 percent.

During the first 9 months, income from crops was one-tenth higher than the same period last year, with receipts from fruit, truck crops, and wheat especially high. Cash receipts from hogs and butterfat dropped sharply, and income from livestock and livestock products declined 6 percent.

CASH RECEIPTS FROM LIVESTOCK AND PRODUCTS COMPARED WITH CROPS, 1910-45

Following a 15-year period beginning in 1910, when cash receipts from crops were about equal to those from livestock and products, there was a marked rise in the proportion of total cash receipts accounted for by livestock. This increase, and a corresponding decrease in the relative importance of crops, took place after 1924, especially between the years 1924 and 1931. During World War II, however, receipts from livestock declined somewhat in relative importance, despite the fact that they rose substantially in absolute amount.

Between 1924 and 1931, income from livestock as a percent of total cash receipts from farm marketings increased from 47 to 60. Cash receipts from all principal groups of livestock and livestock products gained during this period as a percentage of total cash receipts. The greatest gain was made by income from dairy products, which constituted 14 percent of total cash receipts in 1924 and 20 percent in 1931. Cash receipts from cattle and calves and poultry and eggs also made significant gains in percentage shares.

An analysis of the crop groups shows that by far the greatest decline in relative importance during the period 1924-31 was made by cotton (lint and seed). In 1924 income from this category comprised 16 percent of total cash receipts from farm marketings, but by 1931 the percentage had dropped to only 8, with the sharpest declines in 1926 and 1930. Income from food grains and from feed crops each declined from 9 percent to 5 percent of total cash receipts during the 7-year period. The percentage share of fruits and nuts and vegetables increased slightly, and together increased from 11 percent of total cash receipts from farm marketings in 1924 to 15 percent in 1931.

Percentage shares of commodity groups in total cash receipts from farm marketings for the entire 35-year period are presented by years in tables.

During the first 20 years of the period, dairy products increased markedly in relative importance, from 10 percent in 1910 to 20 percent in 1931, and then declined to 15 percent in 1945. The share contributed by poultry and eggs increased over the entire 35-year period from 8 percent in 1910 to 13 percent in 1945. Following some decline in relative importance between 1910 and 1924, the percentage share of cattle and calves increased from 11 percent in 1924 to 15 percent in 1945, the same percentage as in 1910. Hogs were particularly important during the war years 1942-44, but in 1945 dropped back to their prewar level in relation to total cash receipts. The percentage share of sheep and lambs declined during the recent war. Other livestock (largely because of decreased receipts from horses and mules) showed a marked decline in relative importance between 1910 and 1924.

Among the crop groups, cotton (lint and seed) reached a low of about 7 percent of total cash receipts from farm marketings during World War II. This compared with an average of 14 percent for 1910-25. As indicated above, a large part of the decrease in relative importance of cotton occurred from 1925 to 1931, with the sharpest drops in 1926 and 1930, but there have also been marked declines since 1937. The percentage share of feed crops decreased from 10 percent in 1910 to 7 percent in 1945. Although cash receipts from total crops declined in relative importance during the period 1910-45, fruits and nuts, tobacco, and vegetables made definite gains. Together these three groups accounted for 11 percent of total cash receipts in 1910 and 18 percent in 1945. Oil-bearing crops made substantial gains during the recent war years, from 1 percent in 1939 to 3 percent in 1945, as production of soybeans, flaxseed, and peanuts increased to fill war needs. During World War I, the greatest increase in relative importance was in food grains, from 9 percent in 1913 to 13 percent in 1918.

1/ Horses, mules, mohair, and honey.

2/ Preliminary.

Farm Income in Canada

Cash receipts from farm marketings in Canada during the first 6 months of 1945 amounted to 702 million dollars, 8 percent less than 1944, but 28 percent above 1943.

Income from field crops the first half of this year dropped 17 percent below 1944, although it showed a gain of 45 percent over 1943. The greatest decline in 1945, compared with 1944, was registered by cash receipts from wheat --a drop of 32 percent.

Income from livestock products in the first half of 1945 declined very slightly from 1944, but was 23 percent above 1943. Cash receipts from hogs this year decreased 25 percent from 1944, but were 16 percent above 1943. Income from cattle and calves was 27 percent above last year and 47 percent greater than in 1943.

With reduced field crop production, marketings from this source during the last 6 months of 1945 probably are running substantially below the last half of 1944. Income from livestock products may not change greatly during the second half of the year, compared with 1944.

Cash receipts from sale of farm products, Canada, January- June, 1943-45*

Item	1943	1944	1945
	1,000	1,000	1,000
